FLYRANK AI FLUENCY | DILIGENCE CHECKPOINT

Portfolio Hardening Review

Where it breaks, what was fixed, and what still needs a live review.

Project	Review date	Evidence repository
HANY'S WORLD portfolio	13 October 2026	GitHub source and review files

Checkpoint result

The source-level hardening fixes and SEO metadata are recorded in GitHub. This checkpoint is not yet passed: Vercel reports a failed deployment, and live browser/device checks and an independent mentor or peer review have not happened.

What I tried

Inspected the portfolio components and API client for rendered forms, submission paths, clipboard actions, service filters, and external links. Ran static checks confirming the page title, description, Open Graph tags, social preview image, favicon, clipboard helper, and review report exist. Checked whether the local Vite build could run; the Vite executable is missing because dependency installation did not complete.

A direct attempt to reach the candidate Vercel address failed at DNS/network access in this environment. GitHub files were accessible through the connected GitHub integration. No actual browser session, alternate device, link click-through, Google name search, or PageSpeed score could be produced.

Fix-now findings addressed

Finding	Change made
Clipboard failures were not handled consistently. Three copy controls could silently fail or show success without confirming the copy.	Added a shared Clipboard API helper with a legacy fallback. Success feedback now appears only when copying succeeds.
Empty service filter results had no message.	Added an accessible empty-state message in English and Arabic.
Contact API client accepted non-success responses as results.	Now rejects HTTP errors and invalid response shapes, returning a failure message.

Known limitations and unverified checks

No rendered contact form. Source search found an API route and helper, but no form component or call site. Empty/garbage form and rapid double-submit checks do not apply to the current UI; runtime API validation remains unverified.

Live site unavailable. Earlier deployment checks returned 404. Vercel status for commits 0286767 and 895647d reported failure; the connected status did not provide a build reason. The latest state has not been verified in a live browser.

No alternate browser or phone test. The clipboard fallback has source-level hardening only; it has not been exercised across real browser/device combinations.

No search or speed evidence. SEO title, description, Open Graph/Twitter metadata, favicon, and social image are present in source. Public indexing, share preview behavior, and a measured speed score are unconfirmed.

Links and contact delivery. External demo/social links and mail links were not clicked. Mail links require a configured email app. The contact API acknowledges and logs messages but does not persist or email them.

Review status and next step

This PDF is a review-ready evidence package, not proof of an independent review. No mentor/peer review or approval has occurred. The Vercel deployment failure must be diagnosed and corrected; then repeat the empty/garbage and double-submit checks if a form is added, test on another browser/device, click through links, run a public speed check, and ask a mentor or peer to review the findings.
